

You can't have one without the other.

You can't replace a part without ending up with a core. You also can't have reman parts without "seed" cores to build from. Without reman, you can't have the diverse range of coverage you need to support your customers. Aftermarket new suppliers can only afford to supply popular, high-volume applications with easy-to-copy designs. That leaves out older vehicles, low-volume models, and late-model high-tech parts. It also leaves out the ability to offer your customers a lower cost alternative for most products. Without reman, you limit your options – often leaving your customers no choice but to turn to the OE dealer for parts you can't supply.
