Slash Master Cylinder Bleeding Time

Application All vehicles with step-bore master cylinders

Problem Bleeding the step-bore master cylinder is long and tedious.

Solution CARDONE's Master Cylinder Bench Bleeder cuts bench bleeding time in half and is a more effective way to purge the master cylinder of unwanted air. This tool allows you to move more cars through your shop with fewer comebacks.

The CARDONE Master Cylinder Bench Bleeder tool is easy to use:

1. Extract brake fluid from the reservoir.

2. Insert the tip of the bleeder into the port of the master cylinder.

3. Push the brake fluid into the port with the tool.

Part# 10-5000MCB

Repeat the above process for each port to ensure all air has been completely bled from the master cylinder. After bleeding the master cylinder, be sure to perform a conventional bleed at each wheel.
